# The Classification of $(42,6)_{8}$-Arcs 

Anton Betten ${ }^{1}$, Eun-Ju Cheon², Seon Jeong Kim², Tatsuya Maruta ${ }^{3}$<br>${ }^{1}$ Colorado State University, U.S.A.<br>${ }^{2}$ Geongsang National University, South Korea<br>${ }^{3}$ Osaka Prefecture University, Japan

April 2010

## (Some) Finite Geometry:

Let $q$ be a prime power, $q=p^{h}$, with $p$ prime.
A nondegenerate conic in $\operatorname{PG}(2, q)$
EXAMPLE:

$$
Y^{2}=X Z
$$

The $q+1$ points are parametrized as

- $\left(t^{2}, t, 1\right)\left(t \in \mathbb{F}_{q}\right) \quad$ together with
- $(1,0,0)$.

## Properties of Conics

- A large automorphism group:

$$
\begin{aligned}
& \operatorname{P\Gamma L}(2, q) \text { embedded in } \operatorname{P\Gamma O}(3, q) \\
& {\left[\begin{array}{ll}
a & c \\
b & d
\end{array}\right]_{i} \rightarrow\left[\begin{array}{ccc}
a^{2} & a c & c^{2} \\
2 a b & a d+b c & 2 c d \\
b^{2} & b d & d^{2}
\end{array}\right]_{i}}
\end{aligned}
$$

Order: $h(q+1) q(q-1)$

- Any line intersects in at most 2 points.

## Arcs

Definition: $A \subseteq \operatorname{PG}(2, q)$ is $(n, s)_{q}$-arc if

- $|A|=n$,
- no $s+1$ points of $A$ are collinear,
- some s points of $A$ are collinear.

Equivalent Objects:

- $(n, s)_{q} \operatorname{arcs}$
- $[n, 3, n-s]_{q}$ linear codes (projective)
- $\left\{q^{2}+q+1-n, q+1-s ; 2, q\right\}$ minihyper (without multiplicities)

## Arcs

## EXAMPLES:

Conics are $(q+1,2)_{q}$-arcs (a.k.a. ovals)

If $q$ is even, conics together with their nucleus are $(q+2,2)_{q}$-arcs (a.k.a. hyperovals)

## Arcs

An $(n, s)_{q}$ arc is largest
if there is no $(n+1, s)_{q}$-arc.

Q: Given $s$ and $q$, what is the largest $n$ for which an $(n, s)_{q}$ arc exists?

A: It depends, but for

- $s=2$ and $q$ odd, the answer is $q+1$
(i.e., ovals).
- $s=2$ and $q$ even, the answer is $q+2$
(i.e., hyperovals).
- $s=6$ and $q=8$, the answer is 42 .

## Arcs

Q: Can we classify all arcs?
A: Sometimes, but we first need to discuss projective equivalence.

## Symmetry in $\operatorname{PG}(k-1, q)$

## THEOREM: $\operatorname{Aut}(\operatorname{PG}(k-1, q))=\operatorname{P\Gamma L}(k, q)$

Q: What is $\mathrm{P}\ulcorner\mathrm{L}(k, q)$ ?

## Symmetry in $\operatorname{PG}(k-1, q)$

$\operatorname{PGL}(k, q)$ is the group of linear automorphisms of $\operatorname{PG}(k-1, q)$.

$$
|\operatorname{PGL}(k, q)|=q^{k(k-1) / 2} \prod_{i=2}^{k}\left(q^{i}-1\right)
$$

EXAMPLE:

$$
|\operatorname{PGL}(2, q)|=q\left(q^{2}-1\right)=(q+1) q(q-1)
$$

## Symmetry in $\operatorname{PG}(k-1, q)$

## Semilinear maps:

Write $q=p^{h}$ with $p$ prime

## Let $\phi: x \mapsto x^{p}$ be the Frobenius automorphism of $\mathbb{F}_{q}$

$$
\left(x_{0}, \ldots, x_{k}\right)^{\phi}:=\left(x_{0}^{\phi}, \ldots, x_{k}^{\phi}\right)
$$

induces an automorphism of $\operatorname{PG}(k-1, q)$.

## Symmetry in $\operatorname{PG}(k-1, q)$

A semilinear map of $\operatorname{PG}(k-1, q)$ is the map induced by

$$
\mathbf{x} \mapsto(\mathbf{x} A)^{\phi^{i}}
$$

where

$$
A \in \mathrm{GL}(k, q), \quad i \in \mathbb{Z}_{n} .
$$

## Symmetry in $\operatorname{PG}(k-1, q)$

$\mathrm{P}\lceil\mathrm{L}(k, q)$ is the group of all semilinear automorphisms of $\operatorname{PG}(k-1, q)$.

Write $A_{i}$ for the semilinear map induded by

$$
(A, i)
$$

Composition rule for semilinear maps:
$A_{i} \cdot B_{j}=C_{k} \quad$ where $C=A \cdot B^{\phi^{-i}}$, and $k=i+j \bmod h$.
EXAMPLE: $|\mathrm{P} \Gamma \mathrm{L}(2, q)|=h(q+1) q(q-1)$

## Classification of Arcs: $s=2$

## Segre <br> For $q$ odd, all ovals are conics.

For $q$ even, not every hyperoval is of the form "conic + nucleus" (a.k.a. regular).

EXAMPLE: Lunelli/Sce when $q=16$.
Can be written as the symmetric difference of two cubics (Glynn).

## Classification of Arcs: $s>2$

Q: Can we classify all $(42,6)_{8}$-arcs?

A: For $(n, s)_{q}=(42,6)_{8}$, one arc is due to Mason 1984.

For the complete classification, see below...

Observe that $\mathrm{P} \Gamma \mathrm{L}(3,8)$ is a group of order 49448448.

## Notation

$$
(\mathcal{V}, \mathcal{B})=\mathrm{PG}(2,8)
$$

Let $A$ be an $(42,6)_{8}$-arc.

$$
\begin{gathered}
B=\mathcal{V} \backslash A \\
(P)=\{I \in \mathcal{B} \mid P \in I\}
\end{gathered}
$$

the pencil of lines through the point $P$.

## Notation

## A line $I$ is called $i$-line if $|A \cap I|=i$. So, $i \leq 6$.

$\mathcal{L}_{i}$ the set of $i$-lines

$$
a_{i}=\left|\mathcal{L}_{i}\right|
$$

$\left(a_{0}, a_{1}, \ldots, a_{6}\right)$ the line type
Exponential notation: $i^{a_{i}}$

THEOREM
There are five $(42,6)_{8}$-arcs, with groups of order $42,18,72,63,2$. They are...

The constructions will show the complement of the arc.

Take a hyperoval in $\operatorname{PG}(2,8)$ : group order 9•8•7.3
$\mathrm{N} \cdot$

Arc I (Mason arc): group order $7 \cdot 2 \cdot 3=42$

Arc II: group order $3 \cdot 6=18$

Arc III: group order $\frac{168 \cdot 3}{7}=72$

## Arc IV: group order 63

## Arc V: group order 2

| Aut $\mid$ | Arc |  |
| :---: | :---: | :---: |
| 18 | I |  |
| 42 | II |  |
| 72 | III |  |
| 63 | IV |  |
| 2 | V |  |

Lemma 1
An $(n, s)_{q}$-arc satisfies

$$
\sum_{i=0}^{s} a_{i}=q^{2}+q+1, \sum_{i=1}^{s} i a_{i}=(q+1) n, \sum_{i=2}^{s}\binom{i}{2} a_{i}=\binom{n}{2},
$$

This leads to 330 cases of line types.

Lemma 2

$$
a_{1}=0
$$

This reduces the number of cases to 111 .

## Point Types

For a point $P$, let

$$
c_{i}=\left|(P) \cap \mathcal{L}_{i}\right|
$$

The point type is $\left(c_{0}, \ldots, c_{6}\right)$, often written as $6^{c_{6}} \cdots 0^{c_{0}}$

Let $\mathbf{p}_{i}$ be the point types for points in $A$.
Let $\mathbf{q}_{i}$ be the point types for points in $B$.

## Point Types

Lemma 3
The $\mathbf{p}_{i}$ are determined by

$$
\sum_{i=2}^{6}(i-1) c_{i}=41, \quad \sum_{i=0}^{6} c_{i}=9
$$

Lemma 4
The $\mathbf{q}_{i}$ are determined by

$$
\sum_{i=0}^{6}(9-i-1) c_{i}=30, \quad \sum_{i=0}^{6} c_{i}=9
$$

## Point Types

There are $5 \mathbf{p}_{i}$ and $40 \mathbf{q}_{i}$
Observe: the only point type $\mathbf{q}_{i}$ with at least two 0 -lines is $\mathbf{q}_{1}=6^{7}, 0^{2}$

Thus:

- No three 0 -lines are concurrent (the 0 -lines form an arc with $s=2$ in the dual plane).
- For $2 \leq w<6$, a $w$-line intersects a 0 -line in a point not on another 0-line

Q: How many points of type $\mathbf{p}_{i}, \mathbf{q}_{i}$ are there?
Define
$x_{i}=$ the number of points of type $\mathbf{p}_{i}$
$y_{i}=$ the number of points of type $\mathbf{q}_{i}$

Write $s_{i, j}$ for the $c_{j}$ in points of type $\mathbf{p}_{i}$
Write $t_{i, j}$ for the $c_{j}$ in points of type $\mathbf{q}_{i}$

The $x_{i}$ and $y_{i}$ satisfy the following equations:

## Lemma 7

$$
\begin{gather*}
\sum_{i=1}^{5} x_{i}=42 \quad\left(F_{1}\right), \quad \sum_{i=1}^{40} y_{i}=31 \quad\left(F_{2}\right)  \tag{2}\\
\sum_{i=1}^{5} x_{i} s_{i, j}=j a_{j} \quad\left(F_{1, j}\right), \quad \sum_{i=1}^{40} y_{i} t_{i, j}=(9-j) a_{j}  \tag{2,j}\\
\sum_{i=1}^{5} x_{i}\binom{s_{i, j}}{2}+\sum_{i=1}^{40} y_{i}\binom{t_{i, j}}{2}=\binom{a_{j}}{2} \quad\left(J_{j}\right)  \tag{j}\\
\sum_{i=1}^{5} x_{i} s_{i, j_{1}} s_{i, j_{2}}+\sum_{i=1}^{40} y_{i} t_{i, j_{1}} t_{i, j_{2}}=a_{j_{1}} a_{j_{2}} \quad\left(J_{j_{1}, j_{2}}\right)
\end{gather*}
$$

for $j, j_{1}, j_{2} \in\{0, \ldots, 6\}$ with $j_{1} \neq j_{2}$.

If Lemma 7 has no solution, that case can be ruled out.

This reduces the number of cases to 27 .

## EXAMPLE: Case 72

Example: Case 72 is the following column tactical decomposition:

|  |  | $\mathcal{L}_{6}$ | $\mathcal{L}_{4}$ | $\mathcal{L}_{2}$ | $\mathcal{L}_{0}$ |
| :--- | ---: | ---: | ---: | ---: | ---: |
|  | $\downarrow$ | 50 | 18 | 3 | 2 |
| $A$ | 42 | 6 | 4 | 2 | 0 |
| $B$ | 31 | 3 | 5 | 7 | 9 |

Lemma 3 and 4: We find 2 point types $\mathbf{p}_{i}$ and 7 point types $\mathbf{q}_{i}$.

Lemma 7 amounts to solving the following system:

| $x_{1}$ | $x_{2}$ | $y_{1}$ | $y_{2}$ | $y_{3}$ | $y_{4}$ | $y_{5}$ | $y_{6}$ | $y_{7}$ |  |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| 8 | 7 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | $=300$ | $F_{1,1}$ |
| 0 | 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | $=72$ | $F_{2,1}$ |
| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | $=6$ | $F_{3,1}$ |
| 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | $=42$ | $F_{1}$ |
| 0 | 0 | 7 | 6 | 6 | 5 | 5 | 4 | 3 | $=150$ | $F_{1,2}$ |
| 0 | 0 | 0 | 1 | 0 | 3 | 2 | 4 | 6 | $=90$ | $F_{2,2}$ |
| 0 | 0 | 0 | 1 | 3 | 0 | 2 | 1 | 0 | $=21$ | $F_{3,2}$ |
| 0 | 0 | 2 | 1 | 0 | 1 | 0 | 0 | 0 | $=18$ | $F_{4,2}$ |
| 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | $=31$ | $F_{2}$ |
| 28 | 21 | 21 | 15 | 15 | 10 | 10 | 6 | 3 | $=1225$ | $J_{1}$ |
| 0 | 1 | 0 | 0 | 0 | 3 | 1 | 6 | 15 | $=153$ | $J_{2}$ |
| 0 | 0 | 0 | 0 | 3 | 0 | 1 | 0 | 0 | $=3$ | $J_{3}$ |
| 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | $=1$ | $J_{4}$ |
| 0 | 14 | 0 | 6 | 0 | 15 | 10 | 16 | 18 | $=900$ | $J_{1,2}$ |
| 8 | 0 | 0 | 6 | 18 | 0 | 10 | 4 | 0 | $=150$ | $J_{1,3}$ |
| 0 | 0 | 14 | 6 | 0 | 5 | 0 | 0 | 0 | $=100$ | $J_{1,4}$ |
| 0 | 0 | 0 | 1 | 0 | 0 | 4 | 4 | 0 | $=54$ | $J_{2,3}$ |
| 0 | 0 | 0 | 1 | 0 | 3 | 0 | 0 | 0 | $=36$ | $J_{2,4}$ |
| 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | $=6$ | $J_{3,4}$ |

## The Parameters

We find two solutions. They correspond to the following two row-tactical refinements:

Case.72.1

|  | $\mathcal{L}_{6}$ | $\mathcal{L}_{4}$ | $\mathcal{L}_{2}$ | $\mathcal{L}_{0}$ |
| ---: | ---: | ---: | ---: | ---: |
| $\rightarrow$ | 50 | 18 | 3 | 2 |
| 6 | 8 | 0 | 1 | 0 |
| 36 | 7 | 2 | 0 | 0 |
| 1 | 7 | 0 | 0 | 2 |
| 6 | 6 | 1 | 1 | 1 |
| 1 | 6 | 0 | 3 | 0 |
| 10 | 5 | 3 | 0 | 1 |
| 12 | 4 | 4 | 1 | 0 |
| 1 | 3 | 6 | 0 | 0 |

2-lines
concurrent

Case.72.2

|  | $\mathcal{L}_{6}$ | $\mathcal{L}_{4}$ | $\mathcal{L}_{2}$ | $\mathcal{L}_{0}$ |
| ---: | ---: | ---: | ---: | ---: |
| $\rightarrow$ | 50 | 18 | 3 | 2 |
| 6 | 8 | 0 | 1 | 0 |
| 36 | 7 | 2 | 0 | 0 |
| 1 | 7 | 0 | 0 | 2 |
| 6 | 6 | 1 | 1 | 1 |
| 10 | 5 | 3 | 0 | 1 |
| 3 | 5 | 2 | 2 | 0 |
| 9 | 4 | 4 | 1 | 0 |
| 2 | 3 | 6 | 0 | 0 |

2-lines form a triangle

## The Johnson bound for Tactical Decompositions

$(\mathfrak{V}, \mathfrak{B})$ a row-tactical decomposition

|  |  | $B_{1}$ | $B_{2}$ | $\cdots$ | $B_{n}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\rightarrow$ | $b_{1}$ | $b_{2}$ | $\cdots$ | $b_{n}$ |
| $V_{1}$ | $v_{1}$ | $r_{11}$ | $r_{12}$ | $\cdots$ | $r_{1 n}$ |
| $V_{2}$ | $v_{2}$ | $r_{21}$ | $r_{22}$ | $\cdots$ | $r_{2 n}$ |
| $\vdots$ | $\vdots$ | $\vdots$ |  |  | $\vdots$ |
| $V_{m}$ | $v_{m}$ | $r_{m 1}$ | $r_{m 2}$ | $\cdots$ | $r_{m n}$ |

Here, $\mathfrak{V}=\left(V_{1}, \ldots, V_{m}\right)$ and $\mathfrak{B}=\left(B_{1}, \ldots, B_{n}\right)$.

## The Johnson bound for Tactical Decompositions

Lemma 8 (BB 2010)
Let $1 \leq i_{1}<i_{2}<\cdots<i_{s} \leq m$. Assume that

$$
\sum_{j=1}^{n}\left\{e_{j}\binom{f_{j}+1}{2}+\left(b_{j}-e_{j}\right)\binom{f_{j}}{2}\right\}>\binom{\sum_{u=1}^{s} v_{i u}}{2}
$$

where $f_{j}$ and $e_{j}$ are determined by

$$
\sum_{u=1}^{s} r_{i, j} v_{i_{u}}=f_{j} b_{j}+e_{j} \quad 0 \leq e_{j}<b_{j} .
$$

Then the decomposition scheme is not realizable.
This reduces the number of cases to 25 .

| Case | $a_{6}$ | $a_{5}$ | $a_{4}$ | $a_{3}$ | $a_{2}$ | $a_{1}$ | $a_{0}$ | Lem 7 | Lem 8 | Comment |

| 108 | 39 | 24 | 6 | 0 | 0 | 0 | 4 | 1 | 1 | Arc III |

## Case by Case

The remainder is a case-by-case analysis of these 25 line-types.

For this talk, we wish to look at a few cases only.

Recall that the 0-lines form an arc in the dual plane (i.e., no 3 concurrent)

## Case 108 with $a_{0}=4$

The four 0 -lines form a quadrilateral with 6 intersection points.

Thus, it determines a 7th point $Q$, say, and this point completes a Fano plane $\operatorname{PG}(2,2)$.

One can show: the points on the quadrilateral together with $Q$ form the complement of an arc.

This is Arc III with a stabilizer of order 72.

Arc III: group order $\frac{168 \cdot 3}{7}=72$

## Cases 88-102 with $a_{0}=3$

The three 0-lines form a triangle.
The stabilizer of the triangle has order 882.
For the remaining 7 points $X$, we do a computer search.

We find that there are 133 possibilities for such sets $X$.

| Orbit\|Length | properties of $X$ | Aut $\mid$ Arc |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 49 | all collinear | 18 | III |  |  |

## Notation

$m_{P}(\mathcal{L})$ the multiplicity of the point $P$ on the line set $\mathcal{L}$.
$P$ is $i$-point w.r.t $\mathcal{L}$ if $m_{P}(\mathcal{L})=i$.
$M_{i}(X ; \mathcal{L})$ the set of $i$-points in the subset $X \subseteq \mathcal{V}$.

$$
m_{i}:=m_{i}(X ; \mathcal{L})=\left|M_{i}(X ; \mathcal{L})\right|
$$

Special cases:
$M_{i}(\mathcal{L})=M_{i}(\mathcal{V} ; \mathcal{L})$ and $m_{i}(\mathcal{L})=m_{i}(\mathcal{V} ; \mathcal{L})$

## Notation

A Partition $\mu$ of the integer $n$ is an expression

$$
n=n_{1}+n_{2}+\cdots+n_{k}
$$

for some $k$ (with $n_{1} \geq n_{2} \geq \cdots \geq n_{k} \geq 1$
Let $m_{i}$ or $\mu(i)$ be the number of $n_{j}$ with $n_{j}=i$.
Exponential Notation: write $i^{m_{i}}$

$$
|\mu|=\sum_{i} i \mu(i) \quad \text { and } \quad\|\mu\|=\sum_{i} \mu(i) .
$$

Also, for partitions $\mu, \nu$, define a new partition $\mu+\nu$ by putting

$$
(\mu+\nu)(i)=\mu(i)+\nu(i) \quad \text { for all } i
$$

Since any two lines intersect, we have:
Lemma
For $i \neq j,\left|\mu_{\left[\mathcal{L}_{i}\right] ; \mathcal{L}_{j}}\right|=a_{i} a_{j}$.

Here,

$$
[\mathcal{L}]=\bigcup_{l \in \mathcal{L}} I
$$

the set of points covered by the set of lines $\mathcal{L}$.

## The Search Algorithm

## Use the parameters

$$
\begin{array}{ll}
\text { 1. } \mu_{\left[\mathcal{C}_{0}\right] ; \mathcal{C}_{w}} \quad \text { (i.e., } 1^{6} \text { ) } \\
\text { 2. } \mu_{A ; \mathcal{C}_{w}}+\mu_{B^{*} ; \mathcal{L}_{w}} & \text { (i.e., } \left.1^{6}+1^{12} 3^{1}=1^{18} 3^{1}\right)
\end{array}
$$

$$
\text { Here, } B^{*}=B \backslash\left(\left[\mathcal{L}_{0}\right] \cap\left[\mathcal{L}_{w}\right]\right) .
$$

Find and classify all realizations.

## The Search Algorithm

## Step 1:

Up to $\operatorname{P\Gamma L}(3, q)$-equivalence,
choose $a_{0}$ lines $\mathcal{L}_{0}$,
compute the stabilizer H .

## The Search Algorithm

## Step 2:

Up to $H$-equivalence, search for sets $S$ with

- $S \subseteq\left[\mathcal{L}_{0}\right] \backslash M_{2}\left(\mathcal{L}_{0}\right)$
- $|S|=\left\|\mu_{\left[\mathcal{L}_{0}\right] \mathcal{L}_{w}}\right\|$
- $|S \cap I| \leq a_{w}$ for all $I \in \mathcal{L}_{0}$

Compute $K$, the stabilizer of the set $S$ in the group $H$.

## The Search Algorithm

## Step 3:

Up to $K$-equivalence, compute possibilities for a set of lines $\mathcal{L}$ such that:

- $[\mathcal{L}] \cap\left[\mathcal{L}_{0}\right]=S$
- $\sum_{P \in \cap \cap S} m_{P}(\mathcal{L})=a_{w}$ for all $I \in \mathcal{L}_{0}$.
- $\mu_{\mathcal{V} \backslash S ; \mathcal{L}}=\mu_{A ; \mathcal{L}_{w}}+\mu_{B^{*} ; \mathcal{L}_{w}}$.

$$
\text { Put } \mathcal{L}_{w}:=\mathcal{L}
$$

## The Search Algorithm

## Step 4:

Identify more points of either $A$ or $B$ by their intersection number.

For instance, if $\mu_{A_{i} \mathcal{L}_{W}}(i)>0$ and $\mu_{B^{*} ; \mathcal{C}_{w}}(i)=0$
then all $i$-points in $\mathcal{V} \backslash S$ go into $A$.

## The Search Algorithm

## Step 5:

Perform a backtrack search on the remaining points (details omitted).

Thus, $A$ and $B$ are determined

Check the line type

## Conclusion

- Finite geometry:
- Conics,
- Arcs, ovals, hyperovals
- Combinatorial tools:
- Tactical decompositions, diophantine equations
- Parameters (line type, point type, multiplicities, intersection numbers)
- Algebraic tools:
- Symmetry groups
- Algorithmic tools:
- Computing orbits of finite groups
- Theoretical tools:
- Geometric reasoning.
